IMPORTANT CONSIDERATIONS

MANURE TREATMENT LAGOONS

LIVESTOCK BMP #8

Photo courtesy of USDA ARS

Description:
An impoundment made by excavation or earthfill to biologically treat livestock manure or other agricultural wastes, reduce pollution, and protect the environment.

AWQA Minimum Requirements:
Construct lagoons to biologically treat manure to reduce nutrients in it when manure is not used for fertilizer value, and remove excess effluent by irrigation or hauling if needed. The types of lagoons most common in Kentucky are anaerobic lagoons, aerobic lagoons, and anaerobic/aerobic lagoon combinations.

Recommendations:
Locate near the source of manure. Locate downhill from manure, concentrated livestock areas, feedlots, or other waste

generated by agricultural production. Locate out of the floodplain area unless other protective measures are taken. Locate where prevailing winds will minimize odors. Select a site the greatest practical distances from water supplies, streams, and residences. Check soils, rock depth, drainage, and topography for site suitability. Seepage through the lagoon may allow pollutants to move into groundwater. Check and comply with local and state regulation. Consider future livestock expansion, as well as present number, in determining size of lagoons.
